It cloning into a vector that encodes the lanker. The entire scrones, and sequence (AAR29757) is then cloned into vector ppR998 which encodes is expressed in E. coll and purified by affinity chromatography. Thrombin cleavage yields a soluble scrCR useful in detection, diagnosis, functional studies and therapy involving immune responses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δy
    AAA79263 to AAA79736 and AAB25100 to AAB25570 represent polynucleotide

C and protein sequences isolated from eucalyptus (Eucalyptus grandis) or

and protein sequences isolated from eucalyptus (Eucalyptus grandis) or

pine (Pinus radiata also known as Monterey pine). The protein sequences

c pine (Pinus radiata also known as Monterey pine). The protein sequences

c are involved in cell signalling. The polynucleotide and protein

c sequences can be used to modify the response of plant cells to external

c signals e.g. environmental changes or pathogens during the growth and

c development of a plant. They can be used to modify cell proliferation,

differentiation, elongation and survival, resistance to disease and

nutrient metabolism. Examples of modifications which can be produced are

c altered fruit ripening and senescence of leaves and flowers e.g. to

altered fruit ripening and senescence of leaves and flowers e.g. to

c altered fruit in pening the life of cut flowers or enhance

c senescence and prolong the life of cut flowers or enhance

c senescence and prolong the life of cut flowers or enhance

c modifications can be used to delay senescence in selected cell types or

c organs providing fruit and vegetables which have a longer shelf life

c organs providing fruit and vegetables which have a longer shelf life

c forest tree species giving long stretches of valuable knot free clear

c wood which can be used in solid timber furniture and veneers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

The invention relates to isolated polynucleotide (I) and probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PER) primers, oligomers, and for chromosome polymerase chain reaction (PER) primers, oligomers, and for chromosome can dependent and in recombinant production of (II). The cand gene mapping, and in recombinant production of (II). The conjuncted genes are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques conformal activity of (II) or to treat disease states involving or (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. Compressing the protein expression or biological activity. Compressions in the printer conformation of sequences of data and products dependent on DNA and amino acid sequence other types of data and products dependent on DNA and amino acid sequence data for this patent did not appear in the printed conformat man or acid sequence data for this patent did not appear in the printed conformat various because the conformat directly from WIPO conformat directly from WIPO conformat directly from WIPO conformat directly from MIPO conformat directly 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                              New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The invention relates to isolated polynuclectide (I) and polypeptide (II). Sequences. (I) is useful as hybridisation probes, collypeptide (II). Sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The collynuclectides are also used in diagnostics as expressed sequence tags (C for identifying expressed genes. (I) is useful in gene therapy techniques (C for identifying expressed genes. (I) is useful in gene therapy techniques (C (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as imaging of sites expressing (II). (I) and (II) are useful in medical food supplement. (II) and its binding partners are useful in medical activity of sites expressing (II). (I) and (II) are useful in medical insolvers in the polypeptide and polynucleotide sequences have applications in the polypeptide and polynucleotide sequences have applications in responsible for genetic disorders or other traits to assess biodiversity amino acid sequences. Abg00010-Abg30377 represent novel human condition, but was obtained in electronic format directly from WIPO at fire other trains in the printed at the content of the content
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide hormone, antidiabetic; anorectic; antianorectic; antiasthmatic; antidepressant; nootropic; neuroprotectant; hypotensive; hypertensive; cytostatic; cerebroprotective; vasotropic; human.
                                                                                             New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The invention provides polypeptides (AAG55886-55918) which may be peptide hormones (including insulin, growth hormones, chemokines, cytckines, chemokines, inceptides, integrains, kallikreins, lamins, malanins, natruiretic chemones, neuropeptides, integrains, kallikreins, lamins, malanins, natruiretic correctogranins, selectins, thromboglobulins, thymosins) identified by high throughput ganome-based biology and polynucleotides (AAI67176-67208) encoding them. The polypeptides can be expressed by standard recombinant methodology. The polypeptides are useful in the treatment of disease such as diabetes, breast-, prostate-, colon cancer and other malignant tumors, as diabetes, breast-, prostate-, colon cancer and other malignant tumors, asthma, manic depression, dementia, delirium, mental retardation, dementia, delirium, mental retardation, corsual development disorders, and dysfunctions of the blood cascade system including those leading to stroke. The polymorleotides may be used and for chromosome localization and for tissue expression studies. The expression studies. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mouse; Nope; neighbour of punc ell; cytostatic; neuroprotective; vaccine; quene therapy; cerebroprotective; colonic cancer; mental retardation; tumour suppressor; chromosome 9; transgenic animal; genetic disorder; obesity; Bardet-Biedl syndrome; autosomal recessive disorder; retinitis; polydactyly; pigmentosa; hypogonadism; hypertension; diabetes mellitus; renal anomaly; cardiovascular anomaly; extracellular domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
The present invention relates to Nope (neighbour of punc ell) which is used in the prevention, treatment and diagnosis of diseases associated used in the prevention, treatment and diagnosis of diseases associated with inappropriate Nope expression such as cancers especially colonic cancer and genetic disorders, as Nope is thought to be a tumour therapy. Nope is used as vaccine. Nope gene may be administered to treat diseases by rectifying mutations or deletions in a patient's genome that diseases by rectifying mutations or deletions in a patient's genome that adsease by rectifying mutations or deletions in a patient's genome that affect the activity of Nope by expressing inactive proteins or to affect the activity of Nope by expressing inactive proteins or to active the patients own production of Nope polypeptides and their role in metabolism through the creation of transgenic animal their role in metabolism through the creation of transgenic animal chart role anti-Nope anti-Nope and activity for the treatment of the down regulate Nope expression and activity for the treatment of the daracterised by mental retardation, obssity, polydacorder.

Set and hypogonadism. Patients with Bardet-Biedl syndrome have a callovascular anomalies; The present sequence is mouse Nope (neighbour

The invention provides polypeptides (AAG55886-65918) which may be peptide compones, including insulin, growth hormones, chemokines, cytokines, concurpeptides, integrins, kallikreins, lamins, melanins, naturietic neuropeptides, integrins, kallikreins, lamins, melanins, naturietic hormones, neuropepsin, ptuiltary hormones, pleiotrophins, prostaglandins, concertogranins, selectins, thrombolobulins, thymosins) identified by secretogranins, selectins, thrombolobulins, thymosins) identified by concertogranins, reported biology and polynuclectides (AAF7176 67208) in the throuphput genome-based biology and polynuclectides (AAF7176 67208) concertogrant, represented biology. The polypeptides are useful in the treatment of disease such methodology. The polypeptides are useful in the treatment of disease such hyper- and hypotension, obesity, bulimia, anorexia, growth abnormalities, hyper- and hypotension, obesity, bulimia, anorexia, growth mental castman manic depression, dementia, delitium, mental retardation, crossomed development disorders, and dysfunctions of the blood cascade or sexual development disorders, and dysfunctions of the blood cascade of system including those leading to stroke. The polynucleotides may be used as diagnostic reagents through detecting mutations in the associated gene and for chromosome localization and for tissue expression studies. The polypeptides and polynucleotides may also be used as vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mouse; Nope; neighbour of punc ell; cytostatic; neuroprotective; vaccine; gene therapy; cerebroprotective; colonic cancer; mental retardation; tumour suppressor; chromosome 9; transgenic animal; genetic disorder; obesity; Bardet-fiédl syndrome; autosomal recessive disorder; retinitis; polydactyly; pigmentosa; hypogonadism; hypertension; diabetes mellitus; renal anomaly; cardiovascular anomaly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                    Isolated polypeptides, which may be peptide hormones, which are identified by high throughput genome-based biology which identifies genes and gene products as therapeutic targets for treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 1250;

Nope gene is located on chromosome 9 and is used a tumour therapy. Nope is used as vaccine. Nope gene may be administered in gene diseases by rectifying mutations or deletions in a patient's genome that supplement the patients own production of Nope polypeptides. Nope gene their role in metabolism through the creation of Nope polypeptides and their role in metabolism through the creation of transgenic animal models. The anti-Nope antibodies and Nope antagonists may also be used to down regulate Nope expression and activity for the treatment of mardet-nical sundayment with the creation of transgenic animal to down regulate Nope expression and activity for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bardet-Biedl syndrome which is an autosomal recessive disorder characterised by mental retardation, obesity, polydactyly, retinitis pigmentos and hypogonadism. Patients with Bardet-Biedl syndrome have a high incidence of hypertension, diabetes mellitus and renal and cardiovascular anomalies. The present sequence is mouse Nope (neighbour

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, colypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags of for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving or contributing antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as inaging of sites expressing (II). (II) and (II) are useful for treating colsorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in the polypeptide and polynucleotide sequences have applications of diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traats to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences of the invention.

**Colsorous other types of the and products dependent on DNA and diagnostic amino acid sequences of the invention.

**Colsorous other types of the and products dependent on DNA and colsorous data for this patent did not appear in the printed context.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAA65809 to AAA65889 and AAA66058 to AAA66138 represent nucleotide sequences derived from Escherichia coli which inhibit E. coli proliferation. AAA65800 to AAA66055 and AAB15886 to AAB16040 represent nucleotide and protein sequences associated with E. coli proliferation. AAA66057 represent primers used for sequencing E. coli proliferation inhibiting nucleotide inserts in an example from the present invention. Methods from the present invention can be used to identify a proliferation-required gene in a microorganism, by contacting a microorganism with a proliferation-required gene activity inhibitory inhibition occurs in the second microorganism, and determining if inhibition occurs in the second microorganism. The nucleic acid identified as being required for bacterial growth and proliferation, can be used for antisense therapy for killing bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ohlsen KL, Trawick J, Forsyth RA, Froelich JM, Carr GJ;

The present invention relates to novel plant transcription factors from Eucalyptus grandis or Pinus radiata. The present sequence is one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. or eucalyptus, pine, acacia, poplar, sweetgum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of requilatory proteins: bZIP, bZIP family of G-box binding families hellx-loop-helix zipper, homeotic/homeodomain/homeobox/WABS, homeodomain zipper, LIM domain, AP2 and EREBS, zinc finger domains of type 2 Cys2His2, CCAAT box elements and MYB.
                                                Plant; transcription factor; gene expression; eucalyptus; pine; acacia; poplar; sweetgum; teak; mahogany; bZIP; G-box binding factor; basic helix-loop-helix zipper; homeotic; homeodomain; homeobox; MADS; homeodomain zipper; LIM domain; AP2; EREBS; zinc finger domain; type 2 Cys2His2; CCAAT box element; MXB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated polynucleotide encoding a plant transcription factor for producing a plant e.g. a woody plant, preferably eucalyptus or pine, having modified gene expression or modified activity of a polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

US-08-881-509-8 61 1 CLATGSARQLTF 12 Title: Perfect score: Sequence:

Scoring table:

BLOSUM62 Gapop 10.0 , Gapext 0.5

Total number of hits satisfying chosen parameters: 105224 seqs, 38719550 residues Searched:

463

Minimum DB seq length: 0 Maximum DB seq length: 12

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt_40:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

FUNCTION: HYPERTREHALOSAEMIC FACTORS ARE NEUROPEPTIDES THAT
FERVATE THE LEVEL OF TREHALOSE IN THE HEMOLYMPH (TREHALOSE IS
THE MAJOR CARBOHYDRATE IN THE HEMOLYMPH OF INSECTS).
SIMILARITY: BELONGS TO THE AKH / HRTH / RPCH FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                   SPECIES-P.americana;

D-Tyr or tetrafluoro-Tyr residues. The peptide can be used to inhibit TK-mediated signal transduction and is useful for controlling proliferative diseases, e.g. cancer, psoriasis and to treat viral, inflammatory, allergic and cardiovascular diseases.               The present sequence is the CDR3 alpha-region of a human T-cell receptor (TCR), which can be used in the diagnosis, monitoring, prevention and therapy of a tumour disease, specifically renal cell carcinoma.

```

```
A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; complementary peptide; ligand; drug discovery; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
                                                                                                                                                                                                       Human; complementary peptide; ligand; drug discovery; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           45.9%; Score 28; DB 22; Length 10; 55.6%; Pred.                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs -
                                                                                                                                                                                                  The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as respents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; complementary peptide; ligand; drug discovery; drug design.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  14-JUN-2001.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Roberts GW,
```

```
A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are
                                                                                                                                                        generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
                                                                                                                                              The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides

                                                                                                                                                                                                                                                                                           A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; complementary peptide; ligand; drug discovery; drug design.

```
A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
sequence is a complementary peptide provided in the specification.
                                                                                                                                                                                                    Human; complementary peptide; ligand; drug discovery; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                          generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a set of complementary peptide ligands
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; complementary peptide; ligand; drug discovery; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a set of complementary peptide ligands

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
                                                                                                                                   The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; complementary peptide; ligand; drug discovery; drug design.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
                           Human; complementary peptide; ligand; drug discovery; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;
